

Running the Superstore Dashboard Locally

Step-by-step instructions to run **SuperstoreDashboard.jsx** on your own computer using Vite + React + Recharts.

Before you start

You need **Node.js** installed (includes npm). Check by running this in a terminal (Terminal on Mac/Linux, Command Prompt or PowerShell on Windows):

```
node -v
npm -v
```

If you see version numbers, you're ready. If not, download and install Node.js from nodejs.org (choose the LTS version), then re-open your terminal.

Step 1 — Download the file

Save **SuperstoreDashboard.jsx** from the chat. It usually lands in your **Downloads** folder.

Step 2 — Create a new React project

In your terminal, run:

```
npm create vite@latest superstore-dashboard -- --template react
```

Press Enter through any prompts (defaults are fine). Then:

```
cd superstore-dashboard
npm install
npm install recharts
```

Step 3 — Add the dashboard file

Copy **SuperstoreDashboard.jsx** into the project's **src** folder.

Mac / Linux:

```
cp ~/Downloads/SuperstoreDashboard.jsx src/
```

Windows (PowerShell):

```
copy $env:USERPROFILE\Downloads\SuperstoreDashboard.jsx src\
```

Step 4 — Replace src/main.jsx

Open **src/main.jsx** in any text editor and replace its entire contents with:

```
import React from 'react'
import ReactDOM from 'react-dom/client'
import SuperstoreDashboard from './SuperstoreDashboard.jsx'

ReactDOM.createRoot(document.getElementById('root')).render(
  <SuperstoreDashboard />
)
```

Step 5 — Start the dashboard

```
npm run dev
```

The terminal will print a local address, typically:

```
http://localhost:5173/
```

Open that link in your browser. The dashboard should load.

Troubleshooting

Problem	Likely fix
"npm: command not found"	Node.js isn't installed — install it from nodejs.org and reopen the terminal.
Blank page in browser	Check the terminal for red error text — usually a typo in <code>main.jsx</code> or a missing import.
"Cannot find module 'recharts'"	Run <code>npm install recharts</code> again inside the project folder.
Port already in use	Vite will offer a different port automatically — use the link it prints.
